Reflection Memo

What changed from project 1 to this workflow

In Project 1 I did everything inside chat and it was quick to get ideas and it made all the graphs fast, but it was messy because I couldn't really control the steps or rerun it the exact same way. In this workflow I turned it into a real process with a script and a pipeline, so the same inputs produce the same ranking and the same figure every time.

Where is the control now

The control is in the repo and the workflow. The data is in the project folder, the script shows exactly how codex ranked everything, and the action runs the workflow the same way each time it is honestly amazing.

What I would do next if I had one more week

I would make it so my image is the other way around cause after a bunch of codex responses I could not get it to do what I wanted I just kept getting an error about the binary file I couldn't figure out so my PNG is not as good as I wanted it to be.

One accounting application from another class

I could use this same idea for a month end review for how my firm is doing. Like taking a general ledger export, cleaning it into a standard format, ranking the biggest changes from last month, and generating a quick chart that highlights what needs attention. That would make it easier to spot issues fast and it would leave a clear trail of what got checked and what still needed to get checked.
